Technology information: MDE

w3/handheld – data entry with handheld PCs

bar codes and signatures – captured mobile and processed on-line

Scan with your phone, phone with your scanner

Your employee confirms his arrival and departure at the customer on the touch-screen of his mobile handheld computer (MDE).

Taking over of shipments, ordering of spare parts: Your employee receipts with a single scan or a short touch at a line of an option list – in every case without manual input!

And when your employee has finished his work, your customer can sign – directly on the display.

The handheld computers works on-line, or with a local database. In all cases, w3logistics takes care of the data exchange – automatically, while your employee is on his way to the next customer.

When are MDEs most suitable?

MDEs are especially suitable if your employee has to enter data manually often – e. g. with consumables or shipment information. The possibility to work off-line offers further fields of application:

Your employee does not necessarily need access to a mobile network at the place he uses the device – or, you can easily save telecommunication costs by transferring data only if required.

Which advantages do MDEs offer?

- Your employees use standardised equipment.

- All information is shown on the display. Your employees work voucher-less.

- There is less adjustment to the job necessary for new employees, as the terminal equipment can be used intuitively.

- Recorded information is available centrally and immediately: There is no data loss or uncertain transmission times.

- You receive high quality data: Even longer data input is error-free, discrepancies are recognised immediately, and the user is informed instantly.
