Technology information: RFID

w3/rfid – transponder for mobile applications

Transponder and signatures – captured mobile and processed on-line

Transponder readout and update – always and everywhere

Your employee confirms his arrival and departure at the customer on the touch-screen of his mobile handheld computer. Taking over of shipments or check for completeness is simply performed by readout of the transponders.

When he has finished his work successfully, your employee documents this by updating the transponder data.

At the same time, recorded data and status changes are transmitted via a mobile connection without any delay: You and your customers are informed automatically, your planning systems are updated constantly via an interface.

When is w3/rfid most suitable?

Transponders are especially suitable in closed loops, e. g. for marking of loading equipment or for handling of high-value goods. Compared to the widespread bar code technology, they offer a higher life time, a larger data capacity and support for an easy update or change of data.

With w3/rfid, transponder technology becomes available for mobile applications. Employees can use a handy terminal device to read and update transponders when fetching or delivering shipments or when performing service or maintenance at your customers.

Which advantages does w3/rfid offer?

- Your employees use standardised equipment.
- You receive high quality data: Discrepancies are recognised immediately, and the user is informed instantly.

- All information is shown on the display. Your employees work voucher-less.
- Recorded information is available centrally and immediately.
