

Product information about our solution for freight forwarders

w³/sped – the solution for freight forwarders

Mobile Computing – faster information, lower costs

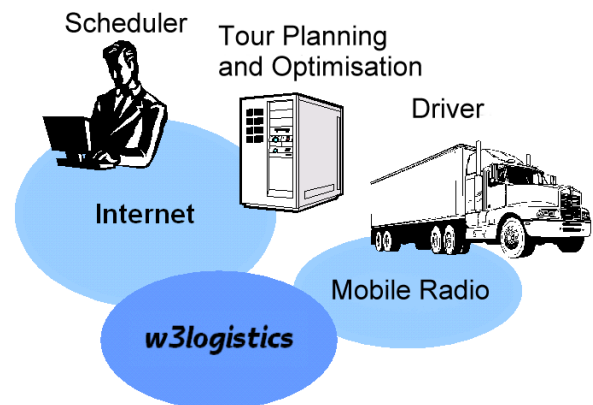

„Shipment delivered!“

Surely you receive messages like this from your drivers every day. But early enough to answer inquiries of your customers?

And how much time needs your scheduler to answer telephone calls of your drivers, to reply to questions, to give new orders?

What is the effort to handle handwritten delivery papers?

Don't you sometimes think this could be much easier?

Confirm delivery and pickup on-line and voucher-less

w³/sped simplifies the communication with your drivers: You plan and optimise the tours with your existing software or the module w³/dispo. Afterwards, the generated orders are imported into w³/sped via an interface.

Seconds later your driver receives all important information.

The driver enters his feedback using a mobile device, if desired even for every single load unit. These status changes are immediately transmitted back into your system – your scheduler has up-to-date data at any time.

Your customers inform themselves via the Internet or can receive automatically generated e-mails.

Which advantages does w³/sped offer?

- You and your customers are informed of the status of all orders and shipments at any time.
- Your schedulers are relieved from the necessity of answering phone calls and double input of data: Work becomes more efficient, error sources are eliminated.
- Combine any mobile devices: Handheld computers with integrated scanner, WAP enabled mobile phones, conventional telephone...
- w³logistics permanently integrates new technologies, such as GPRS and UMTS, thus you always have a modern system.
