

Product information: Scheduling

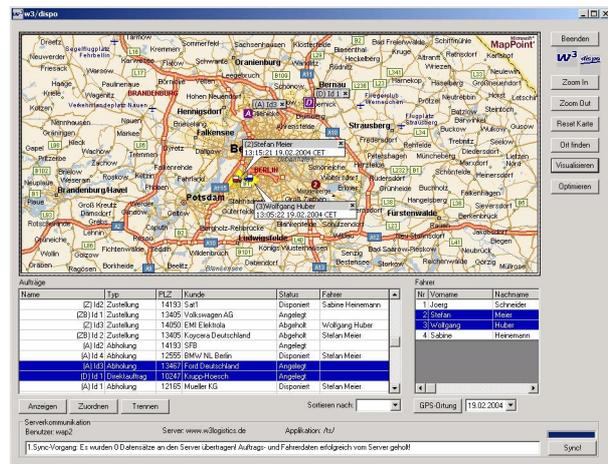

## w<sup>3</sup>/dispo – map-supported order scheduling

Scheduling and driver information – by a single mouse click

### How do your schedulers work with w<sup>3</sup>/dispo?

Your schedulers can see where to pick up shipments or where to perform tasks - and which drivers are in the proximity or are heading for nearby locations. Only one mouse click is necessary to assign an order.

w<sup>3</sup>/dispo is completely integrated into the internet-based architecture of w3logistics - all information regarding a task is transmitted to the driver instantly, thus he can start working on assigned orders immediately, and the scheduler automatically receives a receipt..

### How does w<sup>3</sup>/dispo cooperate with an existing software solution?

If you are already working with a software system for planning and optimisation, order assignments can be imported into w3logistics via an interface.

In this case, w<sup>3</sup>/dispo serves as status visualisation, and for quick re-assignments or for the manual assignment of single orders.

### Which advantages does w<sup>3</sup>/dispo offer?

- w<sup>3</sup>/dispo completes your existing software systems through a full integration.
- Your schedulers are supported by visualisation of all important information details.
- Scheduling is eased by an ergonomic and intuitive user interface.
- w<sup>3</sup>/dispo operates internet based, thus scheduling can be performed from any PC.
